# Time is money - with the new DDMP you save year after year

## Affordable EC Technology for Compact Fans

The DDM range from Nicotra Gebhardt brought the aerodynamic efficiency of the double-inlet, forward-curved direct-driven fan to an unprecedented optimum, thanks to the combination of the highly-efficient scroll and impeller design with a motor installation concept, which reduces to a minimum the negative interference of the motor on the fan aerodynamic efficiency.

The new DDMP adds the Energy-efficient EC technology and a new smart motor controller to the aerodynamic efficiency of the DDM, creating a radically new compact fan, ideal for application wherever space is at a premium.

## Why Forward-Curved Fans for 2020 and beyond

The introduction of the high-efficiency EC drive system brought fans designed for HVAC applications, to efficiency levels that would have, only a few years ago, been impossible using induction motors. Nevertheless, for many years such drive systems have been available only for a limited variety of fans, mostly of the backward-curved type.

It is widely known that under the same working conditions, backward-curved fans can achieve optimum efficiency levels much higher than those reached by the forward-curved design. Nevertheless, designers are fully aware that, in a large number of applications, especially in HVAC equipment installed indoors, the constraints from the available space mean that backward-curved fans often under-perform in terms of efficiency and quietness.

Forward-curved fans are the solution here: their smaller size, for a given duty, in comparison to backward-curved fans with or without scroll, allow for a better sizing of the fan where available space in the application is limited.

So far, the unavailability of a high-efficiency drive system on forward-curved fans has been a major setback.

The Nicotra-Gebhardt DDMP range now opens-up a new freedom to choose the most appropriate fan geometry, for each application, without compromising the efficiency of the fan drive system.

## Low-Noise Solution

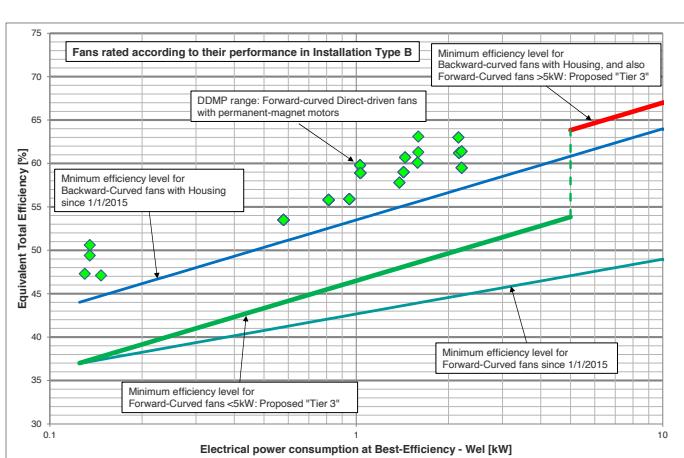

In addition to their compact design, forward-curved fans are better suited where fan noise is critical. The sound power generated by forward-curved fans is mostly made up by medium and high-frequency noise, providing better sound quality at source, and easier attenuation with acoustic linings and silencers. Passive silencers can be both more effective and smaller, in comparison with the arrangement which is needed to achieve the same attenuation with the typical acoustic pattern of a backward-curved fan.

The new DDMP design, with an improved shape and a smaller motor, further increases the advantage of the forward-curved fans in acoustically-critical installations, by streamlining the flow-path, and reducing turbulence and noise generation.

## ERP Compliance for the Future

The Nicotra Gebhardt DDMP direct-driven centrifugal fans significantly exceed the strict minimum efficiency limits, set by the European ErP Directive and its related regulation for 2015. The DDMP efficiency is so high that it exceeds the minimum efficiency levels proposed for forward-curved fans, in the next third tier and actually aligns with the target levels proposed for backward-curved fans in the same tier.

The high-efficiency of the DDMP is retained even when the fan is operating at part-load, helping air-conditioner and heat-pump designers to achieve aggressive targets in terms of seasonally-averaged consumption figures, whether SEER or SCOP.

## Low-Cost of Ownership

The DDMP is conceived to reduce all five contributors to the life-cycle cost of a fan:

**Purchase cost:**

- the DDMP fan is engineered for fast-rate and cost-effective series production.

**Installation cost:**

- the one-piece functional unit does not need connection and configuration to be operated, out-of-the-box, in its basic operation mode: it's a plug-and-play drop-in unit;
- the different advanced operational modes can be configured on the same standard fan, with a simple computer program and a connection cable, providing design flexibility without having to stock many different variants of the same fan.

**Maintenance cost:**

- with its high performance, DDMP is an alternative to belt-driven fans, effectively removing the cost of any perodical belt maintenance;
- the electronic control unit, which is the most critical component for the operating life of an EC fan, is designed to be a line-replaceable unit, considerably extending the operational life of the fan without extensive reworking.

**Energy cost:**

- the DDMP typically halves the power consumption, in comparison with old-technology solutions.

**Disposal cost:**

- the DDMP is built with minimum usage of non-recyclable materials.

## Advanced Manufacturing Technology

The manufacturing technology used for production of the DDMP fans is specifically conceived to provide consistent quality across a large production run.

The DDMP scrolls are manufactured on automatic assembly stations, from pressed and rolled components made of galvanised steel plate, according to a patented process.

The high-efficiency impellers are also manufactured from galvanised-steel parts, on automatic and dedicated, purpose-built machinery.

Each fan is configured, test-run and balanced at the end of the assembly line.

## Advanced Motor Technology

The DDMP drive system is built around a new series of external-rotor, permanent-magnet motors, specifically designed for integration within double-inlet fans.

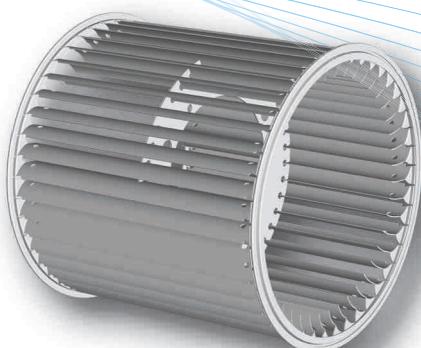

The use of high intensity neodymium magnets allows both an improvement of the energy efficiency of the motor, over more common permanent-magnet motors using ferrites, and a reduction in size.

Thanks to this revolutionary choice, and to a careful design, the new Nicotra Gebhardt PM motors achieve IE5 efficiency levels.

The increased compactness of these new motors leads to a new streamlined motor shape design, further reducing the interference created by fitting the motor inside the fan.

By design, these drive systems are insensitive to the frequency of the power supply, so the DDMP single-phase fans are suitable for operation with any power network at 50 or 60 Hz frequency, in the 220-240 V nominal voltage range.

## Smart EC Motor Controllers

The motor controllers or “drivers”, fitted to the DDMP fans, are currently two single-phase units, of either 1 kW or 2 kW nominal input power, both incorporating an advanced active input stage, providing power factor control (power factor is continuously adjusted to unity).

This design also provides harmonics filtering to guarantee compliance with the EMC requirements applicable to domestic and equivalent environments (“first environment”), or with the advanced requirements for harmonic distortion which apply to data centres.

These drive systems comply with C1-class levels for power-drive systems, according to EN 61800-3, throughout the range of EMC requirements, and also with the more demanding immunity requirements for industrial environments, according to EN 61000-6-2.

All these driver units have been designed with sensorless technology, to simplify their architecture and increase their operational reliability.

New three-phase additional models are covered by a separate catalogue.

The DDMP drivers are factory-configured to operate in their simpler operating mode, i.e. with continuous speed control, having the fan speed proportional to an analogue input signal (0-10 Vdc or PWM).

The drivers incorporate advanced protection features, preventing the user from exceeding the safety limits of the driver and the motor. If the combination of the air system configuration and the speed demand from the user bring the fan to exceed one or more of the limits, which are set for input power, motor torque, or operating temperature of the electronics, then the fan speed and power requirement is automatically restricted, to bring-back the fan within safe operating conditions.

The performance diagrams of the different DDMP fan models, under standard laboratory conditions, as shown in this catalogue, already account for this automatic restriction of the fan performance according to power and torque limits.

If the software protection features should not be enough, a thermo-switch is fitted inside all motors, to stop the drive-system, preventing any permanent damage from overloading and overheating.

This control mode can compensate a change of the pressure-loss in the air system, e.g. because it was not exactly known at the time of choosing a ventilation unit, or because some filter clogging occurs during the operation of the system.

The target value of the volume flow rate can be assigned in three different ways:

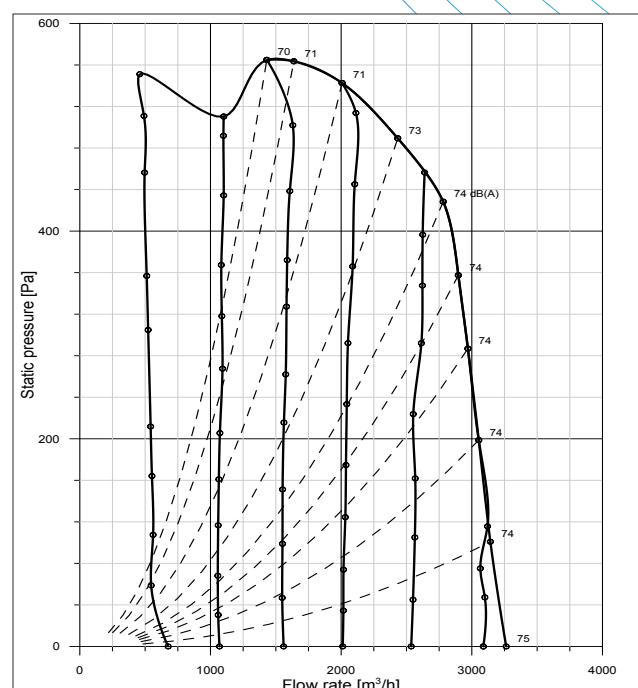

- A. can be set via the analogue input,
- B. can be permanently stored in an Eprom register, via Modbus interface (a kind of “write and forget” mode), or
- C. can be written in a volatile register, via Modbus again, when continuous adjustment of the target level is required.

The difference between modes B and C is that a register in the Eprom memory of the driver can be written only a large but limited number of times; on the other side, the value stored in the Eprom register is preserved even if the fan driver is powered-off. This approach should be preferred when the fan has to be configured for a given performance level, at the time of commissioning, and then left working without further adjustment.

The Modbus link is then no longer needed for operation, but may still be useful, at a later stage, for fan troubleshooting or re-configuration.

In comparison, the volatile register of the micro-processor in the driver, used in interface mode C, can be written an infinite number of times, so this is the approach of choice when the target value has to be continuously adjusted via Modbus, having the drawback that its value must be re-assigned whenever the fan is started again after having been powered-off.

Constant Airflow Curve Graphic

## Advanced Operating Modes

The smart drivers can provide advanced functions, extending way beyond the simple speed control and safety monitoring.

Different, advanced operating modes can be activated with the use of a dedicated software for PC and an RS485 interface cable.

### Constant-Volume Modes

A group of operating modes provide automatic operation at constant volume-flow-rate, without the need for an external probe or sensor, like a hot-wire probe or a pressure transducer.

The DDMP drivers can take advantage of the physical properties of the forward-curved fans, and determine the fan duty-point from a measurement of the fan speed and power consumption, and then adjust the fan speed to keep a set value of the volume flow rate, within a pre-determined range and the limit set by the maximum power and torque of the drive system.

## Alternative Speed-Control Modes

Also in speed-control modes, the target speed value can be provided by Modbus, either on a permanent Eprom register, or in a volatile register, like in cases B and C listed above. Including the analogue-input speed-control mode, which is set up as factory default, the speed control modes are available for each of the three alternative input channels, A, B or C.

## Asynchronous Emulation Modes

Those customers using the fan in a simple speed-control mode may be unsatisfied by a side-effect of the automatic power and torque protection feature, applied to forward-curved fans: in a relatively wide range of slopes of the pressure-loss curve of the air system, the DDMP fan may be unable to reach its nominal maximum speed, or just the speed set by the user, because the power or torque limit is reached before the fan can reach the desired speed.

As a consequence, a user adjusting the fan speed, most often manually and with a potentiometer connected to the analogue input, may suspect a malfunction when, above a certain setting of the potentiometer, any further change has no perceivable effect at all.

To avoid this undesirable effect, the DDMP drivers offer a group of optional operating modes called "Asynchronous emulation". These modes simulate the familiar behaviour of a fan driven by a high-slip AC motor and an electronic voltage controller, where a turn of the knob of the speed controller is always producing a change in the speed of the fan, between the minimum and the maximum, whatever the pressure-loss curve may be.

In an asynchronous emulation mode, the speed, power and torque limits of the fan are combined together and linked to the desired performance input. As a result, the "performance control input" (whether analogue, or numerical via Modbus) is converted into a demand for a fraction of the fan achievable performance, between the minimum and the maximum which is achievable along the pressure-loss curve of the air system: there are no "dead input ranges", but the direct linearity between input signal (or numerical input) and the fan speed is lost.

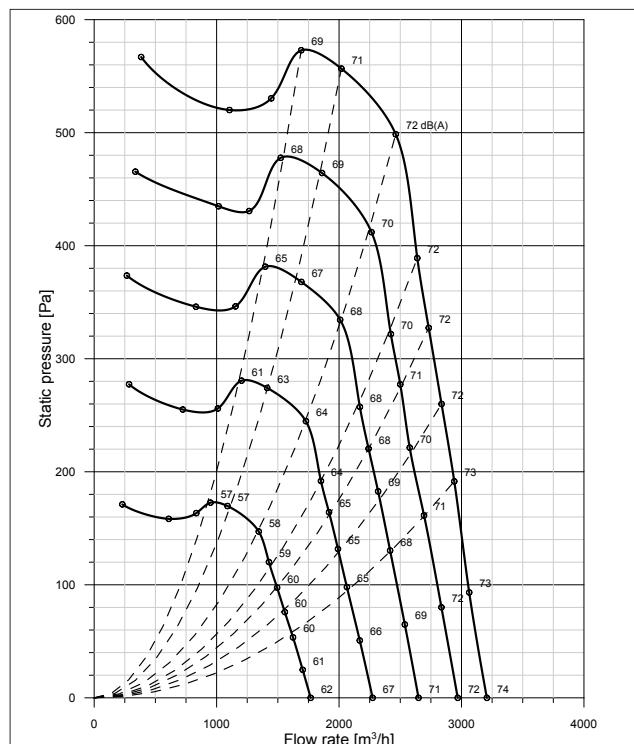

The three asynchronous emulation modes differ for the channel used to provide the setting for the required fan performance: by analogue input signal (0-10 Vdc or PWM), by writing a "slip percentage" in a permanent Eprom register via Modbus, or in a continuously-adjustable but volatile register, via Modbus again, like the three cases A, B and C, described for the constant-volume modes.

## PID Modes

Another group of selectable operating modes is providing PID control using the analogue input channel for the measurement of a status variable with an external sensor, e.g. a value of pressure or temperature, or a concentration of CO in the air, which can be kept to a desired value by adjustment of the fan speed and volume.

As the analogue input channel is needed for the signal from the external sensor or transducer, the target value for the PID must be set via the Modbus interface, either permanently in an Eprom register, or in a volatile register.

## Example Asynchronous Emulation

## Slave Mode

A last advanced mode is the "Slave" mode, in which the DDMP fan is set to closely follow the speed of another DDMP fan, the "master fan", which is running in any one of the other operating modes, by conforming the speed of the slave fan to the tachometric output signal generated by the master. This control arrangement is not required to operate a number of DDMP fans in parallel, when they are run in a plain speed-control mode and driven by the same speed-setting input, but is highly recommended, to prevent system instability, when more fans in parallel are operating either in a closed-loop constant-volume or PID mode.

Note: some restrictions on maximum pressure may exist, when running forward curved fans in parallel, and in a constant-volume or PID closed-loop modes.

Running the DDMP fans in parallel in a Master & Slave control arrangement, avoids the risk that each fan may independently start "hunting," in a frustrating endless search of a stable duty.

## The DDMP “metric-range”

The DDMP range has a downward extension, to relatively tiny fans, of sizes of 146 mm or less, with power input limited to 220 W, single-phase.

These fans retain the high operating efficiency of their larger and more powerful relatives, but have been simplified to reduce their cost.

The driver is provided with a passive EMC filter, very effective but much simpler than the active unit adopted on the 1 kW and 2 kW units.

On these fans there is no Modbus interface, and the operating mode is limited to a simple speed control, with the fan speed proportional to the analogue input voltage (0-10 Vdc or PWM).

Power supply for a potentiometer and a tachometric output are also provided.

Because of the very small size of the scroll of these fans, the 220W drivers are not fitted to the side-plate of the fans, but are supplied separately, and are connected to the motor cables with quick-connection plugs.

For any additional information on the fans from this part of the range, please refer to the dedicated catalogue

## Specifications

### DDMP 1 kW & 2 kW Range

Direct-driven, double-inlet forward-curved centrifugal fan, with high-efficiency drive system. The drive system includes a high-efficiency external-rotor permanent-magnet motor and a smart electronic motor driver, providing speed-control and self-protection against overloading or overheating.

The external-rotor motor, using high-intensity magnets for better efficiency and compactness, is directly integrated in the hub of the impeller and supported on both sides with streamlined brackets, incorporating integral vibration dampers.

The single-phase 1kW or 2kW drivers, fitted to the fan scroll case, provide advanced control functions as well as both analogue and digital external interfaces, and incorporate an active power factor control device, keeping the fan power factor constantly at optimum values, as well as restricting harmonic distortion on the supply network.

The solid scroll cases are made of a pair of pressed side-plates, incorporating the streamlined inlet nozzles, and a rolled backplate, all of galvanized steel, joined, without welding, with a patented cold-rolling process, to prevent both corrosion and vibration.

The high-performance forward-curved impellers directly bolted onto the motor, are also made of galvanised steel plate, and assembled by cold-forming, to preserve the corrosion-protecting effect of the zinc layer on the surface of the steel plate.

### DDMP 200 W range

Direct-driven, double-inlet forward-curved centrifugal fan, with high-efficiency drive system.

The drive system includes a high-efficiency external-rotor permanent-magnet motor and an electronic motor driver, providing speed-control and self-protection against overloading or overheating.

The external-rotor motor is directly integrated in the hub of the impeller and is supported on streamlined brackets, incorporating integral vibration dampers.

The single-phase 200 W drivers are delivered loose, to be installed besides the fan, and are connected to the motors with quick-attachment plugs.

The drivers provide speed control according to an analogue input signal, and incorporate a passive EMC filter, restricting harmonic distortion on the supply network.

The solid scroll cases are made of a pair of pressed side-plates and a rolled backplate, all made of galvanized steel, joined by spot-welding.

The high-performance forward-curved impellers are also made of galvanised steel plate, and assembled by cold-forming, to preserve the corrosion-protecting effect of the zinc layer on the surface of the steel plate.

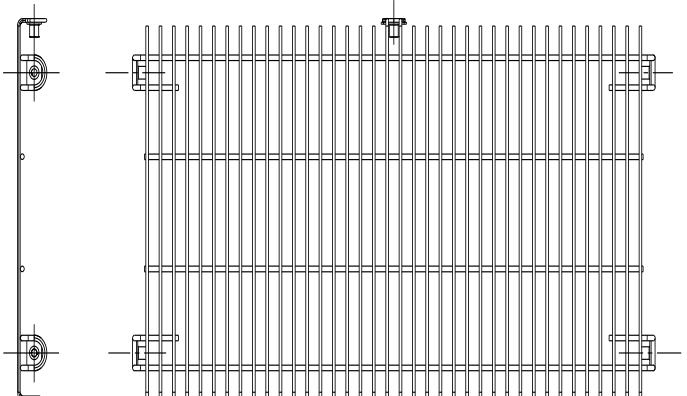

## Accessories

Besides the basic DDMP fan, Nicotra Gebhardt can supply a number of accessories, which may significantly simplify the fan installation:

- mounting feet, suitable for fastening to the scroll side-plates,
- additional outlet flanges or counter-flanges
- flexible connectors for the fan outlet opening,
- inlet guards in accordance to ISO 13857,
- outlet guards in accordance to ISO 13857

and many others.

A complete list can be found inside the special catalogue dedicated to the accessories for AT-DD-DDM and DDMP fans, freely available from the download area of the Nicotra-Gebhardt website.

### ErP Data acc. to Reg. 327/11/CE

Performance referred to the best efficiency duty point

Compl. with Reg. 327/11/EC: Tier II (2015)

Overall Efficiency ( $\eta \times C_c$ ) [%]: 49.0

Measurement category: B

Efficiency category: Total

Efficiency grade N [%]: 55.4

A variable speed drive is integrated with this fan

Manufactured since: 2016

By:

Regal Beloit Italy S.p.A.  
 Via Modena 18  
 24040 Ciserano - Italy

Power input [kW]: 0.961

Volume flow rate  $qv$  [m³/s]: 0.410

Total Pressure [Pa]: 1057

Speed [rpm]: 2676

Specific ratio: 1.01

Information on:

- Disassembly, recycling and disposal at end of life

- Optimal installation, use and maintenance of fans

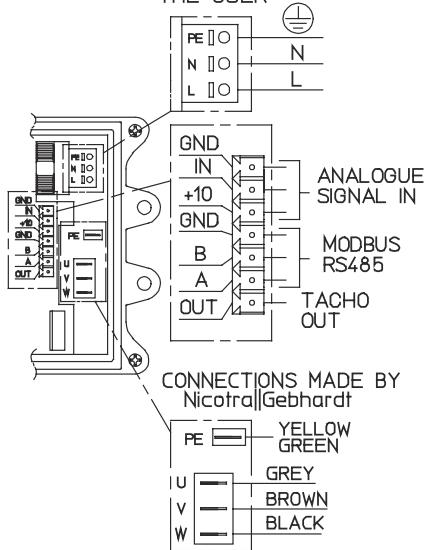

are freely downloadable from

[www.nicotra-gebhardt.com](http://www.nicotra-gebhardt.com)

Testing is carried out with the optional components of the test airway required, according to ISO 5801:2007, for the installation type detailed here on top.

### ErP Data acc. to Reg. 327/11/CE

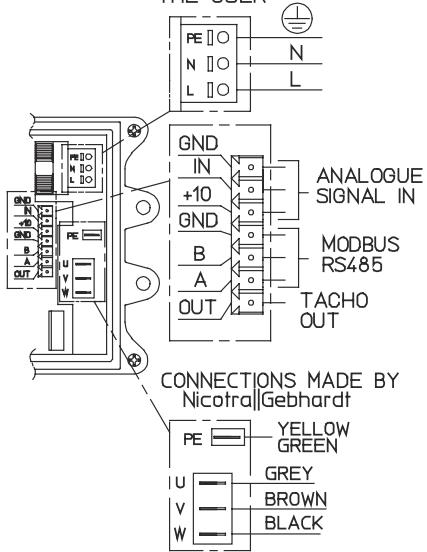

Performance referred to the best efficiency duty point

Compl. with Reg. 327/11/EC: Tier II (2015)
Overall Efficiency ( $\eta \times C_c$ ) [%]: 59.0
Measurement category: B
Efficiency category: Total
Efficiency grade N [%]: 64.4
A variable speed drive is integrated with this fan
Manufactured since: 2016
By: Regal Beloit Italy S.p.A. Via Modena 18 24040 Ciserano - Italy
Power input [kW]: 1.427
Volume flow rate qv [m³/s]: 0.893
Total Pressure [Pa]: 877
Speed [rpm]: 1986
Specific ratio: 1.009

Information on:  
 - Disassembly, recycling and disposal at end of life  
 - Optimal installation, use and maintenance of fans  
 are freely downloadable from  
[www.nicotra-gehardt.com](http://www.nicotra-gehardt.com)

Testing is carried out with the optional components of the test airway required, according to ISO 5801:2007, for the installation type detailed here on top.

### APPLICATION CONSIDERATIONS

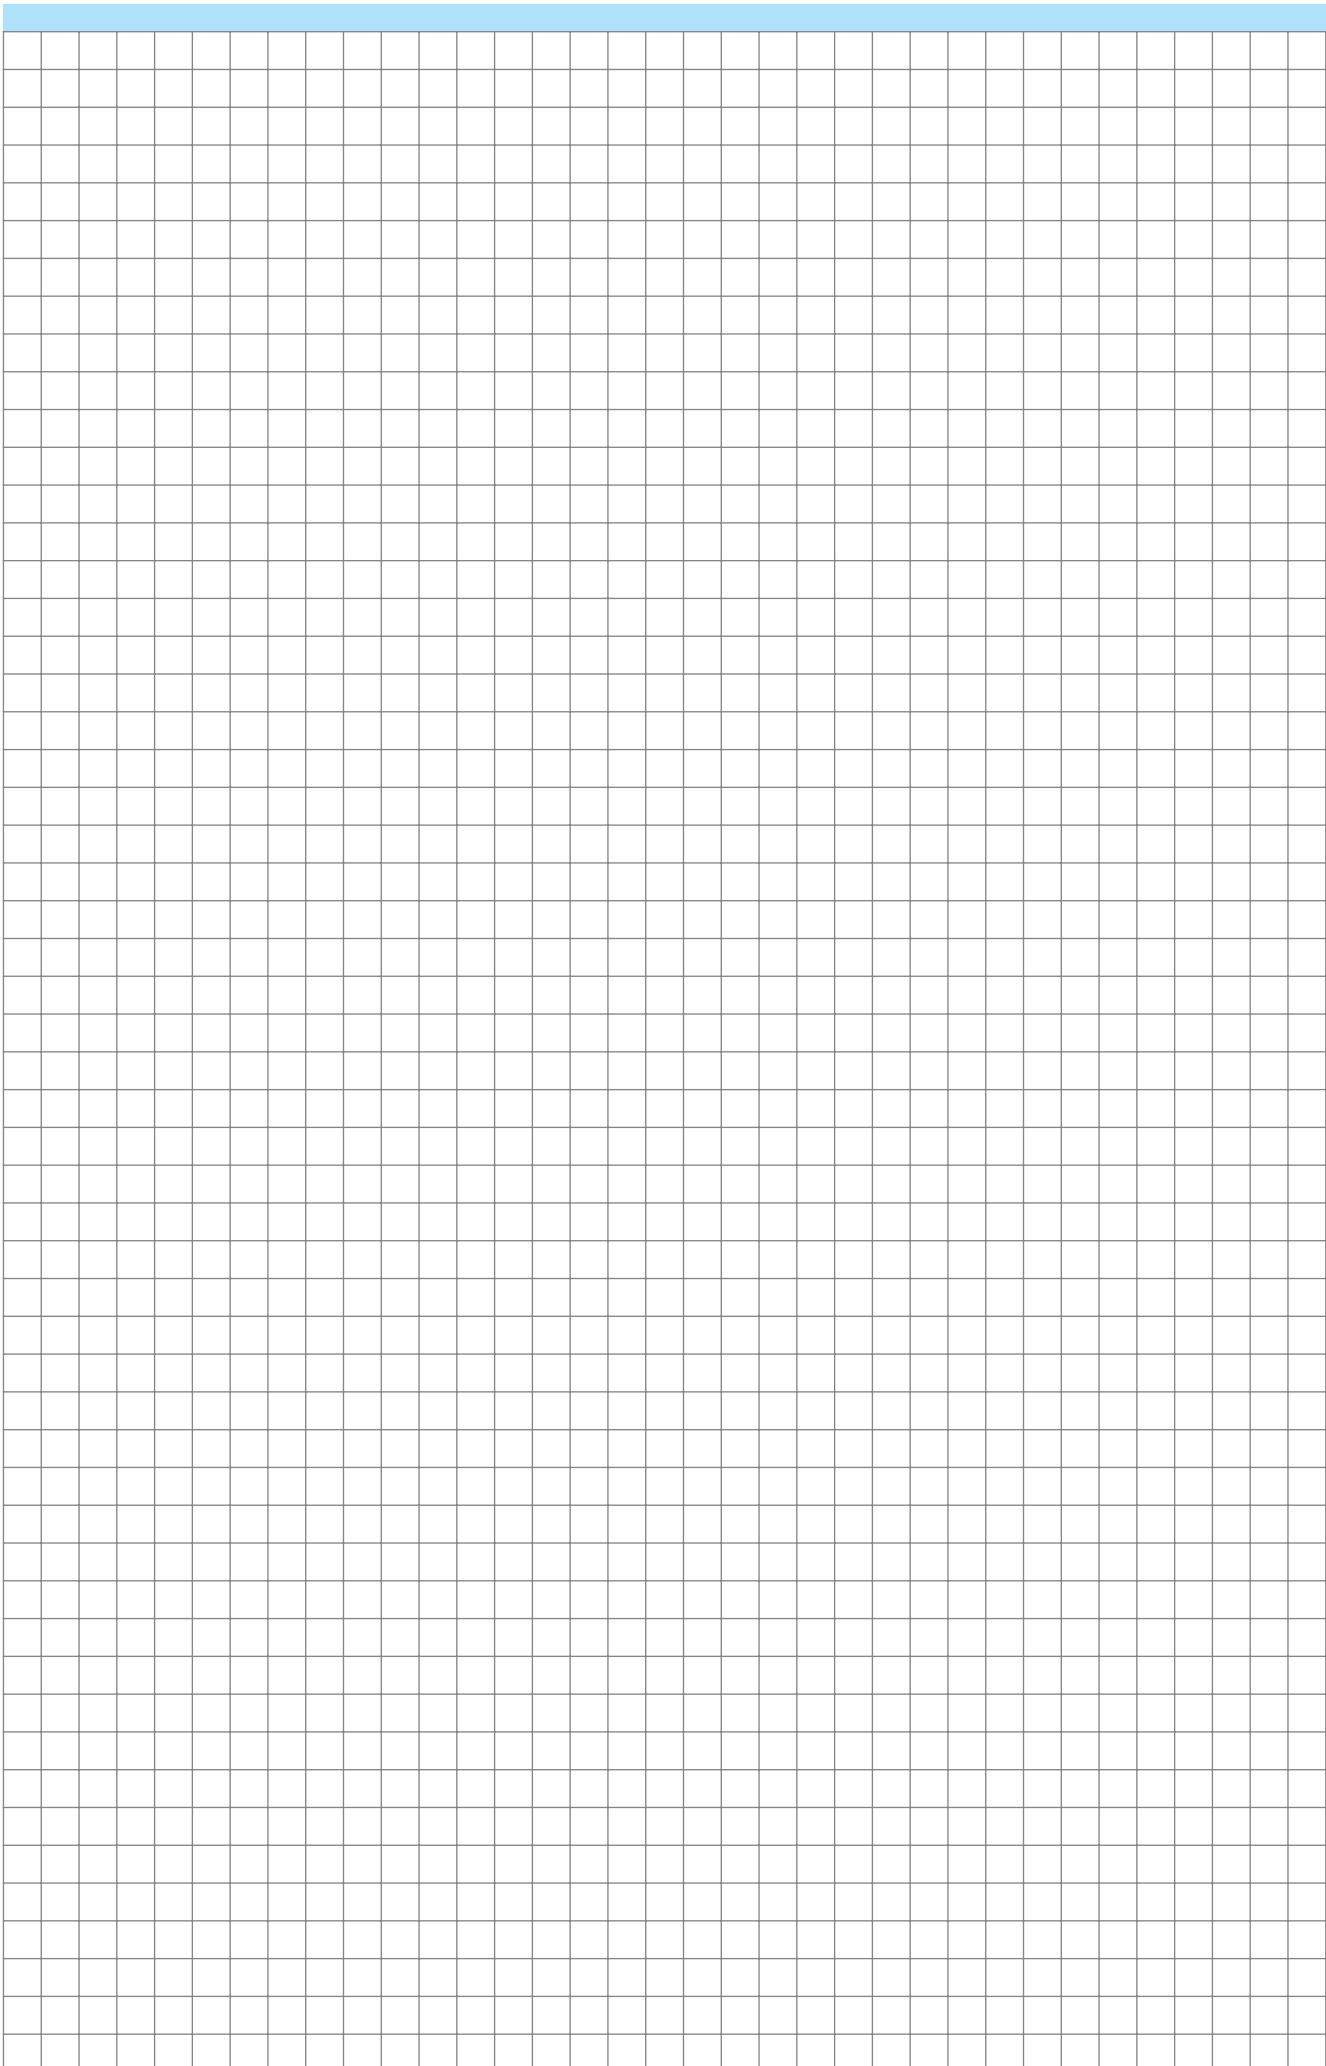

The proper selection and application of products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Beloit America, Inc. and/or its affiliates ("Regal") with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, please visit <https://www.regalbeloit.com/Terms-and-Conditions-of-Sale>. These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal product referred to herein, including any person who buys from a licensed distributor of these branded products.

# DDMP

2.6 kW – 3-Phase models

## The DDMP range extends to 3-phase models

The DDMP range is now extended to include five additional models, covering the same fan sizes already available with the 2kW Single-phase drives, from size 9/9 up to 12/12, using by the new 3-phase external-rotor drive systems, with input power up to 2.6 kW.

The new 3-phase models share many characteristics with the single-phase models already available since long.

This attachment to the DDMP catalogue describes the new features, which are specific of the three-phase models, as well as the performance of these new fan models.

Please refer to the DDMP Single-phase catalogue for additional information on all the other common features.

The 3-phase DDMP range is going to receive a further considerable extension with the release of a range of higher-toque motors and of a further step upwards in power, to 4.0 kW and beyond.

Please, keep in contact with your Nicotra Gebhardt sales representative, to receive timely updates on the latest additions to the DDMP range.

## Smart EC 3-phase motor controllers

The new 3-phase motor controllers, or “drivers”, fitted to the DDMP fans, have a nominal maximum input power of 2.6 kW. These new drivers use the same box-shaped driver case with IP55 protection grade, fitted to the scroll side-plate, already used for the DDMP 2 kW single-phase drivers.

These drivers comply with the EMC requirements for class C2 of power-drive systems, according to EN 61800-3. As such, they are suitable for use in the “first environment”, under condition that they are incorporated into an apparatus, system or installation, which is neither a plug-in device nor a movable device. Such devices shall have to be installed and commissioned only by a professional.

According to the EN 61000-3-2 standard (“Limits for harmonic current emissions – equipment input current  $\leq 16$  A per phase –”), these devices are classified as “professional devices having total input power greater than 1 kW”. Direct connection to a low voltage supply (public networks) may be allowed insofar as this has been approved by the respective energy distribution authority.

The 3-phase DDMP power drive systems comply with the emission requirements set by the EN 61000-6-4 standard for use in industrial environments and also with the immunity requirements for industrial environments, according to EN 61000-6-2.

All these driver units have been designed with sensorless technology, to simplify their architecture and increase their operational reliability.

Like the single-phase models, also the 3-phase DDMP drivers are delivered already configured for use in their basic operating mode, i.e. with continuously-adjustable speed, with the fan speed proportional to an analogue input signal (0-10 Vdc or PWM).

The drivers incorporate advanced protection features, preventing the user from exceeding the safety limits of the driver and motor. If the combination of the air system configuration with the speed demand from the user should bring the fan to exceed one or more of the limits, which are set for input power, motor torque, or operating temperature of the electronics, then the fan speed and power requirement would be automatically reduced, to bring-back the fan within safe operating conditions.

All the diagrams of the different DDMP fan models in this catalogue, showing the fan performance under standard laboratory conditions, already account for this automatic restriction of the fan performance, according to speed, power and torque limits.

If the software protection features should not be enough, a temperature-sensitive switch is fitted inside all motors, to stop the drive-system, thus preventing any permanent damage from overloading and overheating.

By design, these drive systems are insensitive to the frequency of the power supply, so all the DDMP three-phase fans are suitable for operation with any power network at 50 or 60 Hz frequency, in the 400V +/- 10% voltage range.

## Advanced operating modes

The 3-phase smart drivers provide the same selectable advanced operating modes, which are available from the less powerful single-phase units. Please refer to the existing catalogue for single-phase models, for further details.

All the three-phase DDMP models fitted with the three-phase drivers of the model 1431G0 can also provide the autonomous constant-volume operating mode, which has been characteristic of the single phase DDMP models <sup>(1)</sup>.

The ease of operation of these new 3-phase drivers has been further improved, with a better capability to manage the transitory effect of a short loss of power supply or control signal, with a smoother transition.

These new 3-phase drivers also incorporate another useful feature: they can be configured to quickly skip across a chosen range of operating frequencies, to avoid any speed range which may excite structural resonance in the fan installation.

1) Note: A limited production run of developmental three-phase DDMP fans has been completed with driver type 1431F0, which is missing the constant-volume operating function. These fans can be upgraded to the full DDMP specification with a firmware update.

## Advanced SW interface

Please note that the Nicotra Gebhardt “Fan Configuration Program”, formerly used to provide a flexible user interface for monitoring and configuration of the fans with single-phase drivers, is no longer suitable for use with the new Three-phase drivers.

The former Nicotra Gebhardt Fan Configuration Software Revision 2 can connect to the three-phase drivers and still provide some basic monitoring functions, but cannot read a number of the new parameters, and is definitely not suitable to configure the three phase drivers.

A brand-new and more advanced monitoring and configuration software tool, “Fan Configurator”, has been specifically developed, to support the new three-phase drivers, as well as all the former single-phase units.

Regal Beloit recommends to all the customer to download and install the most recent release of the Nicotra Gebhardt Fan Configurator, providing complete coverage of our EC-driven product range and some useful additional features.

Please, contact Regal Beloit Italy if you have any difficulties when downloading the new software package from the Nicotra Gebhardt website.

## Extended analogue interface

To support those customers who connect the DDMP fan to an electromechanical control system, the new 3-phase smart drivers also provide the alarm signal using an electromechanical relay (closed during normal operation, open without power supply or in case of fault), suitable for 250 Vac / 30Vdc 5A , as well as through the normal low-power digital output.

## Specifications

### DDMP 2.6 kW 3-Phase range

Direct-driven double-inlet double-width backward-curved fan with scroll, with integrated high-efficiency drive system and impeller.

The IP54 drive system includes a high-efficiency external-rotor permanent-magnet motor and a smart electronic motor driver, providing speed-control and self-protection against overloading or overheating.

The external-rotor motor, using high-intensity rare-earth magnets for better efficiency and compactness, is directly integrated in the hub of the impeller and supported on rubber vibration dampers, fitted to pressed-steel brackets, bolted to both fan inlets.

The three-phase 2.6 kW driver, fitted into a special-purpose housing, is bolted onto the side plate of the fan scroll case, and provides advanced control functions, including constant-volume operation, as well as the external interfaces, both analogue and digital. The driver incorporates passive EMC filters, keeping the fan power factor constantly at optimum values, as well as reducing harmonic distortion and emissions.

The three-phase drive system complies with the requirements of the class C2, for EMC- compatibility levels, according to EN 61800-3 standard for power-drive systems, throughout the range of EMC requirements, including the immunity requirements for industrial environments, according to EN 61000-6-2.

Additional and optional filters may be available, to fulfil tighter requirements, like compliance with emission requirements for residential applications, or requirements on harmonic distortion for highly sensitive installation in the industrial or IT environments.

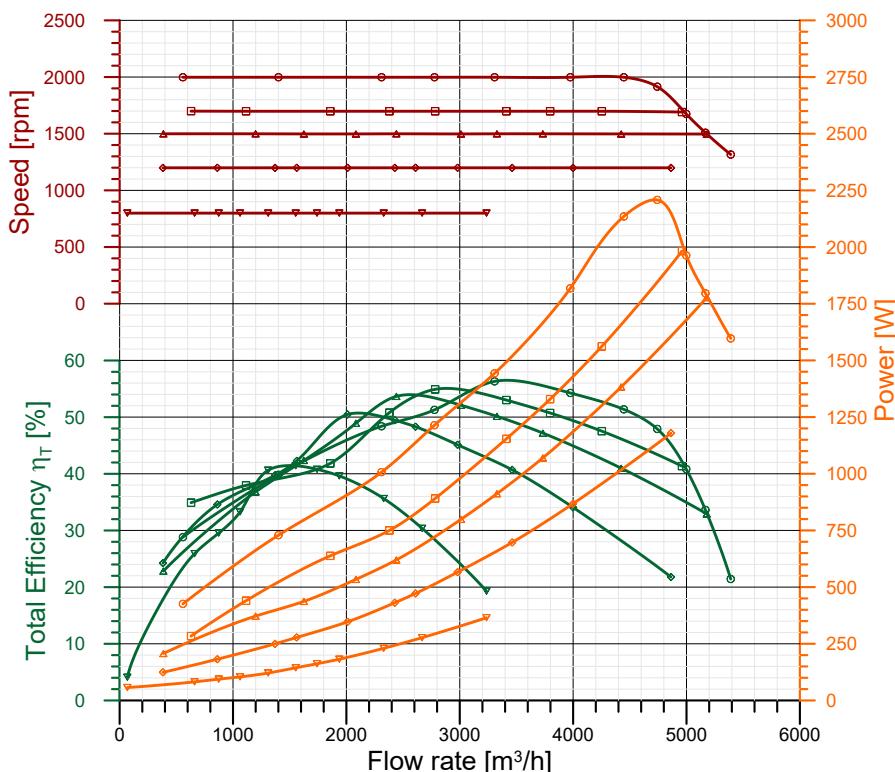

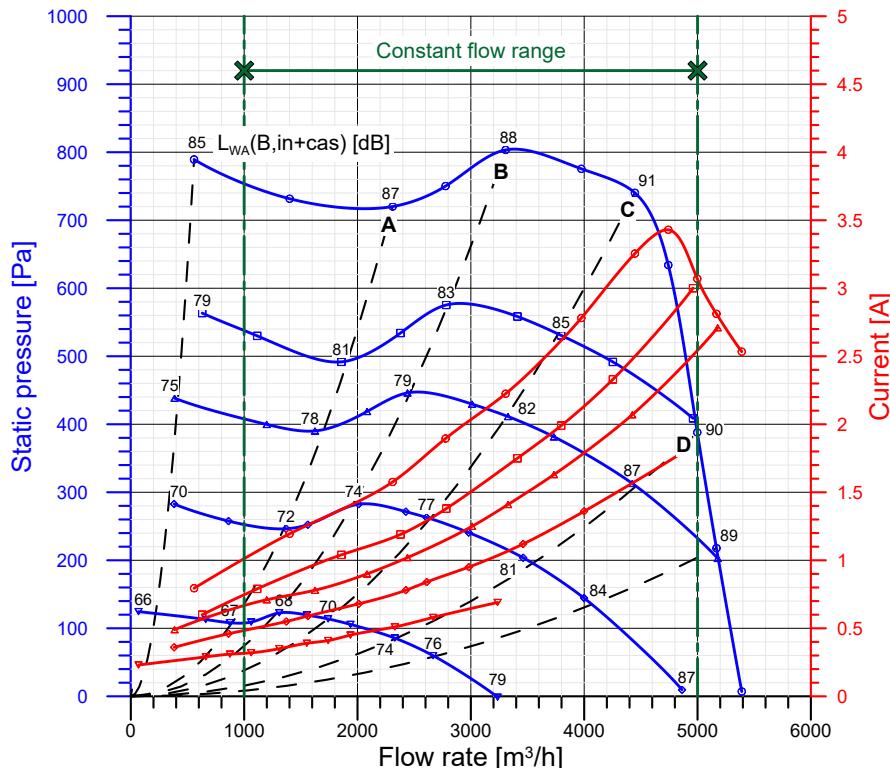

The solid scroll cases are made of a pair of pressed side-plates and a rolled backplate, all made of galvanized steel, joined by spot-welding.

The high-performance forward-curved impellers are also made of galvanised steel plate, and assembled by cold-forming, to preserve the corrosion-protecting effect of the zinc layer on the surface of the steel plate.

The 6-7 character p/nos., traditionally used to identify the DDMP fans, are progressively replaced by a new 16-character structured coding system. This transition is taking place, in steps, for all the EC-driven fans in the Nicotra Gebhardt product portfolio.  
The following table provides a cross-coding reference for the existing most-standard DDMP models.

Single fans, box-packaged Old 6-character part/nos.	Single fans, box-packaged New 16-character part/nos.	Full pallet-load Multiple-package, Old 6-character part/nos.	Full pallet-load Multiple-package, New 16-character part/nos.	Description

### ErP Data acc. to Reg. 327/11/CE

Performance referred to the best efficiency duty point

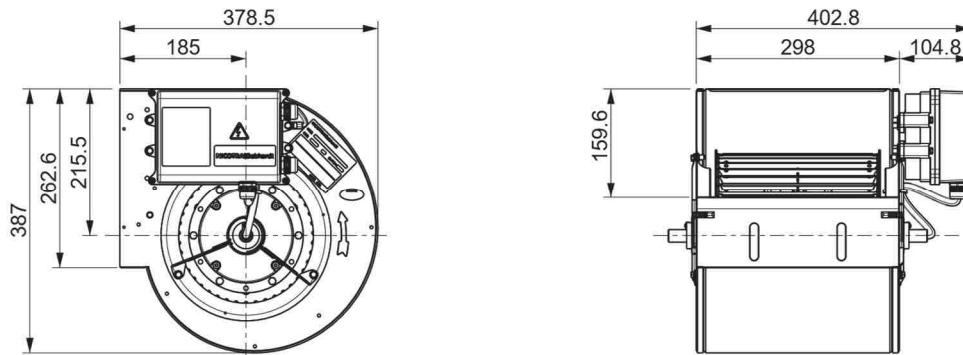

Compl. with Reg. 327/11/EC: Tier II (2015)  
Overall Efficiency ( $\eta \times C_c$ ) [%]: 60.7  
Measurement category: B  
Efficiency category: Total  
Efficiency grade N [%]: 66.0  
A variable speed drive is integrated with this fan  
Manufactured since: 2019  
By:  
Regal Belloit Italy S.p.A.  
Via Modena 18  
24040 Ciserano - Italy  
Power input [kW]: 1.443  
Volume flow rate qv [m³/s]: 0.919  
Total Pressure [Pa]: 886  
Speed [rpm]: 1998  
Specific ratio: 1.009  
Information on:  
- Disassembly, recycling and disposal at end of life  
- Optimal installation, use and maintenance of fans  
are freely downloadable from  
[www.nicotra-gehardt.com](http://www.nicotra-gehardt.com)  
Testing is carried out with the optional components of the test airway required,  
according to ISO 5801:2007, for the installation type detailed here on top.

This test data obtained in a laboratory registered by AMCA for AMCA 210/07 air performance testing. Data is not certified by AMCA.

### ErP Data acc. to Reg. 327/11/CE

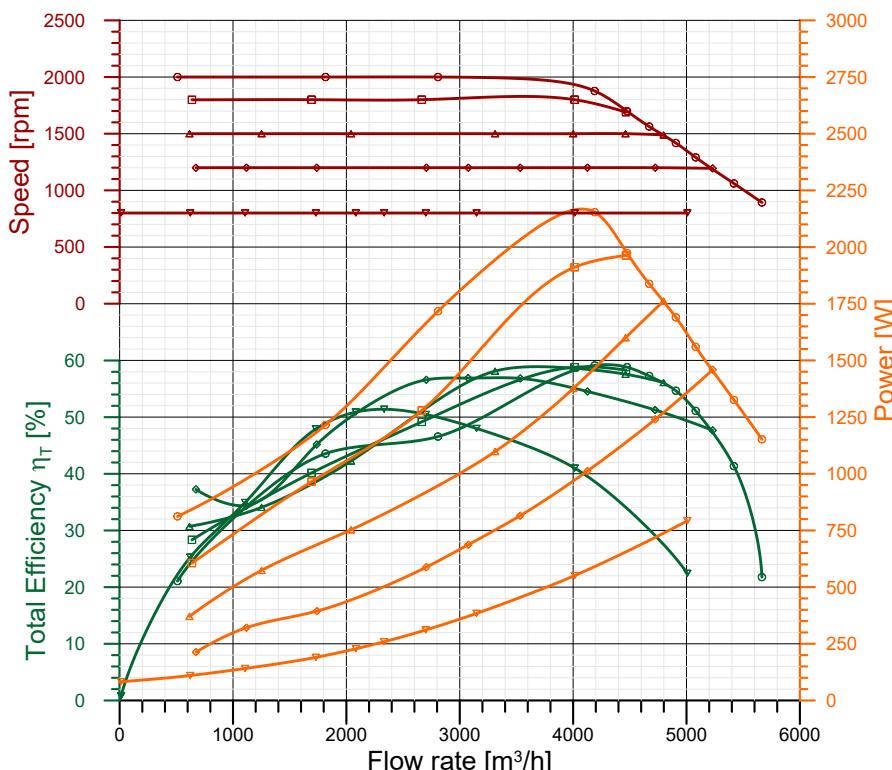

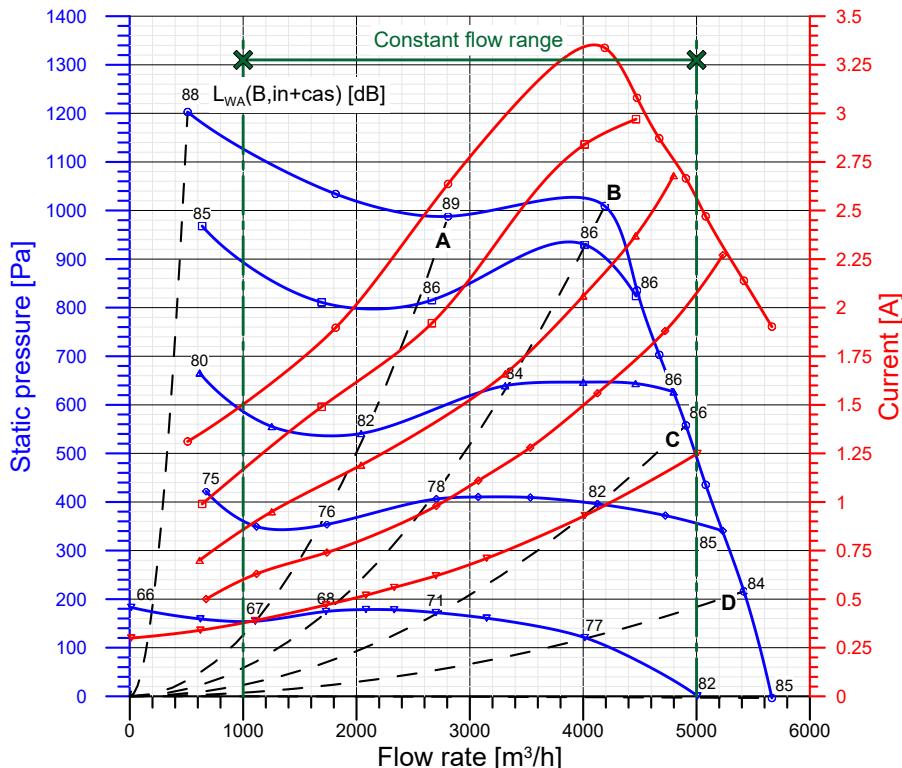

Performance referred to the best efficiency duty point

Compl. with Reg. 327/11/EC: Tier II (2015)

Overall Efficiency ( $\eta \times C_c$ ) [%]: 61.3

Measurement category: B

Efficiency category: Total

Efficiency grade N [%]: 66.4

A variable speed drive is integrated with this fan

Manufactured since: 2019

By:

Regal Belloit Italy S.p.A.  
Via Modena 18  
24040 Ciserano - Italy

Power input [kW]: 1.594

Volume flow rate qv [ $\text{m}^3/\text{s}$ ]: 1.171

Total Pressure [Pa]: 779

Speed [rpm]: 1334

Specific ratio: 1.008

Information on:

- Disassembly, recycling and disposal at end of life

- Optimal installation, use and maintenance of fans

are freely downloadable from

[www.nicotra-gehardt.com](http://www.nicotra-gehardt.com)

Testing is carried out with the optional

components of the test airway required,

according to ISO 5801:2007, for the

installation type detailed here on top.

Test nr.: S5669 Date: 30/01/2019  
 Laboratory: Nicotra Gebhardt S.p.A. - Zingonia  
 Test chamber: 10000 m³/h

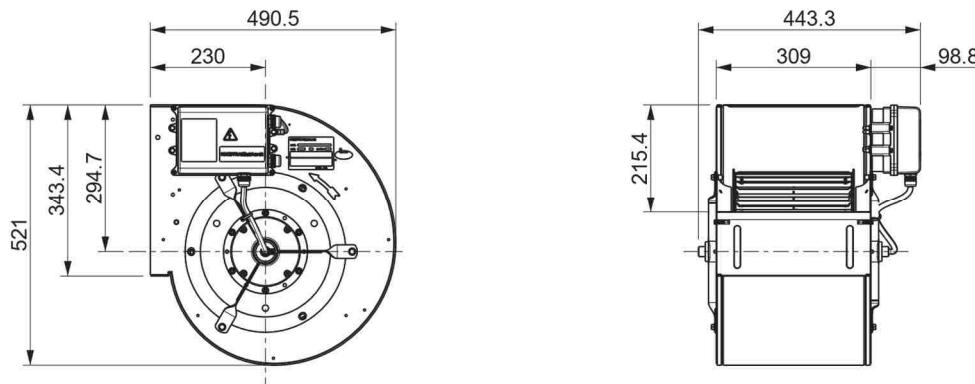

Produced with NG Fan Datasheet Template Ver. B-BC+FC-1.3, on 02/03/2021

This test data obtained in a laboratory registered  
 by AMCA for AMCA 210/07 air performance testing.  
 Data is not certified by AMCA.

### APPLICATION CONSIDERATIONS

The proper selection and application of products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Beloit America, Inc. and/or its affiliates ("Regal") with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

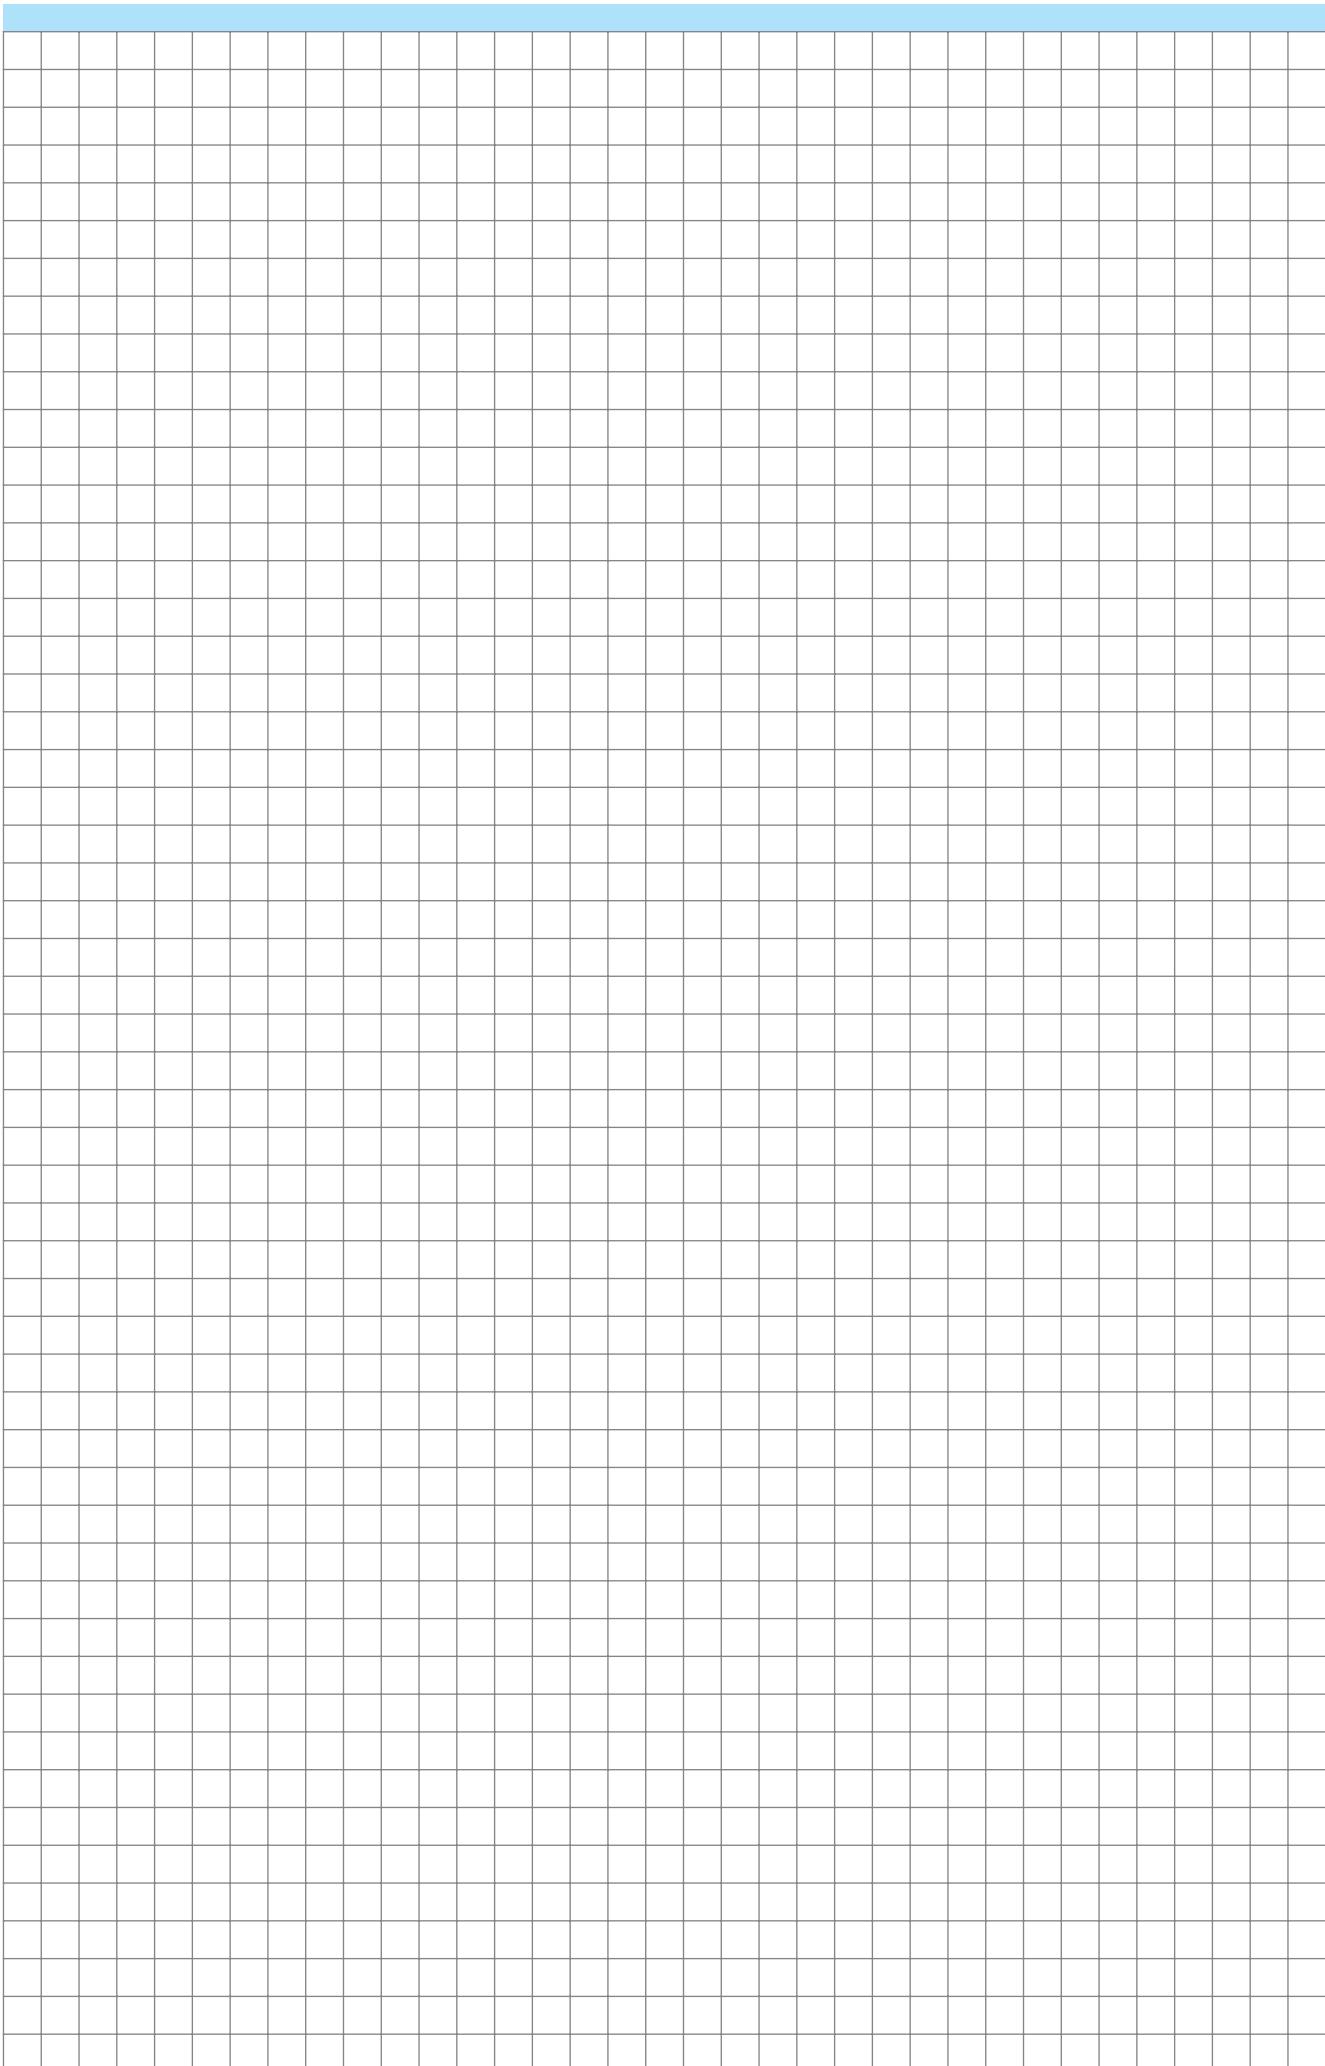

For a copy of our Standard Terms and Conditions of Sale, please visit <https://www.regalbeloit.com/Terms-and-Conditions-of-Sale>. These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal product referred to herein, including any person who buys from a licensed distributor of these branded products.

# DDMP

## SMALL-METRIC SIZES

CATALOGUE 2021

## The DDMP “metric-range”

The DDMP range has a downward extension, to relatively tiny fans, of sizes of 146 mm or less, with power input limited to 220 W, single-phase.

These fans retain the high operating efficiency of their larger and more powerful relatives, but have been simplified to reduce their cost.

The driver is provided with a passive EMC filter, very effective but much simpler than the active unit adopted on the 1 kW and 2 kW units.

On these fans there is no Modbus interface, and the operating mode is limited to a simple speed control, with the fan speed proportional to the analogue input voltage (0-10 Vdc or PWM).

Power supply for a potentiometer and a tachometric output are also provided.

Because of the very small size of the scroll of these fans, the 220W drivers are not fitted to the side-plate of the fans, but are supplied separately, and are connected to the motor cables with quick-connection plugs.

## Specifications

Direct-driven, double-inlet forward-curved centrifugal fan, with high-efficiency drive system.

The drive system includes a high-efficiency external-rotor permanent-magnet motor and an electronic motor driver, providing speed-control and self-protection against overloading or overheating.

The external-rotor motor is directly integrated in the hub of the impeller and is supported on streamlined brackets, incorporating integral vibration dampers.

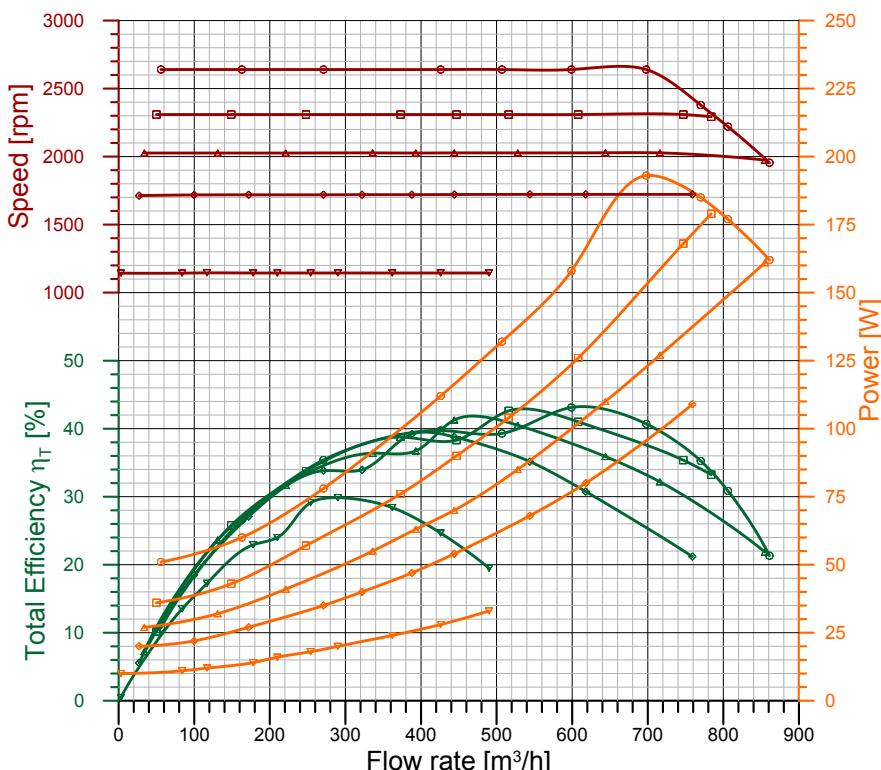

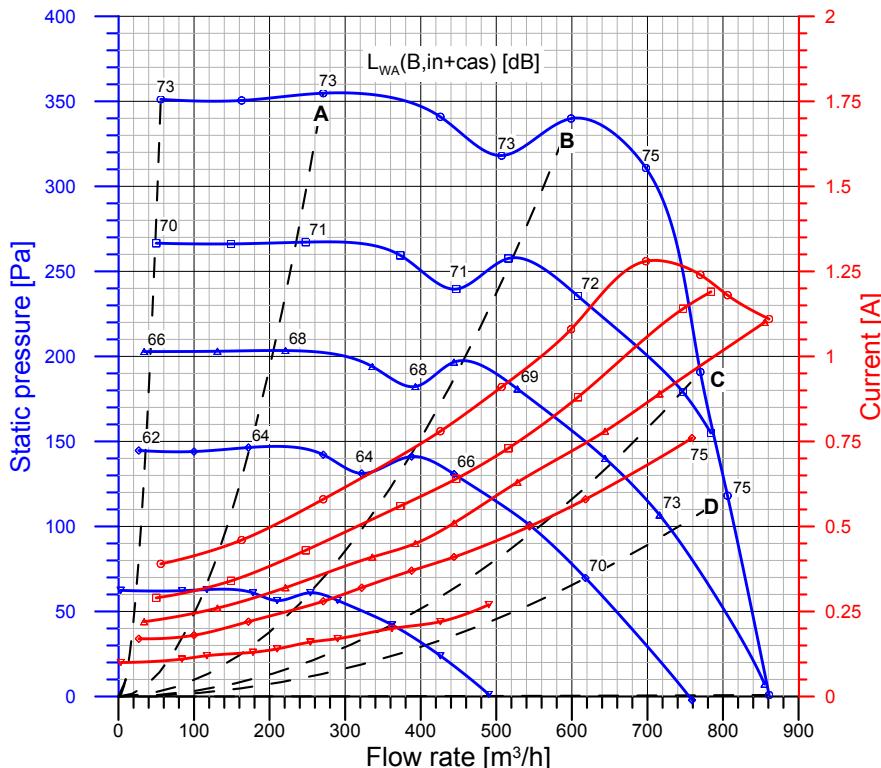

The single-phase 220 W drivers are delivered loose, to be installed besides the fan, and are connected to the motors with quick-attachment plugs.

The drivers provide speed control according to an analogue input signal, and incorporate a passive EMC filter, to restrict harmonic distortion on the supply network.

The solid scroll cases are made of a pair of pressed side-plates and a rolled backplate, all made of galvanized steel, joined by spot-welding.

The high-performance forward-curved impellers are also made of galvanised steel plate, and assembled by cold-forming, to preserve the corrosion-protecting effect of the zinc layer on the surface of the steel plate.

### APPLICATION CONSIDERATIONS

The proper selection and application of products and components, including the related area of product safety, is the responsibility of the customer. Operating and performance requirements and potential associated issues will vary appreciably depending upon the use and application of such products and components. The scope of the technical and application information included in this publication is necessarily limited. Unusual operating environments and conditions, lubrication requirements, loading supports, and other factors can materially affect the application and operating results of the products and components and the customer should carefully review its requirements. Any technical advice or review furnished by Regal Beloit America, Inc. and/or its affiliates ("Regal") with respect to the use of products and components is given in good faith and without charge, and Regal assumes no obligation or liability for the advice given, or results obtained, all such advice and review being given and accepted at customer's risk.

For a copy of our Standard Terms and Conditions of Sale, please visit <https://www.regalbeloit.com/Terms-and-Conditions-of-Sale>. These terms and conditions of sale, disclaimers and limitations of liability apply to any person who may buy, acquire or use a Regal product referred to herein, including any person who buys from a licensed distributor of these branded products.
